AEGIS3 · SEED PITCH

Aegis3

Enterprise Launch Integrity & Transaction Security for Web3 Protocols

Eliminating multi-million-dollar bot exploitation and scam vulnerabilities during token distributions.

Laukik Wani· Industrial & Systems Engineering · Chirag Janbandhu · Geology and Geophysics ·
IIT Kharagpur

Token launches suffer catastrophic vulnerabilities on both sides

Protocol bleed

Professional bot farms deploy thousands of coordinated wallets to extract airdrop rewards; immediate post-TGE dumping can crash token prices by 80–90%, damaging protocol economics and alienating real users.

Community exposure

Scammers deploy spoofed claim sites and Permit2 signature exploits during launch hype. Crypto wallets show only raw unreadable code — users cannot see what a contract does before clicking Confirm

BOTTOM LINE

Over $494M

extracted in 2024 alone by airdrop bot cartels and malicious claim drainers. *(Scam Sniffer 2024 Annual Report)*

02 · THE PRODUCT

Aegis3 creates an inbound and outbound defense layer

Two connected protection modules secure the protocol and the user around one launch layer.

Inbound defense

For protocols

Explainable Sybil scoring clusters coordinated wallets across time and funding sources, replacing blunt ban-lists with transparent, tiered allocation scores.

SECURE LAUNCH LAYER

Integrity across distribution

Outbound defense

For users and wallets

A real-time transaction simulator dry-runs pending transactions in under 50 milliseconds and converts contract behavior into human-readable balance-impact warnings before signing.

Network Science Meets EVM Virtualisation

An end-to-end data pipeline transforming raw multi-chain activity into explainable security verdicts.

01 · Data Ingestion & State Slicing

- **Multi-Chain Archive RPC Nodes:** High-throughput ingestion across Ethereum, Arbitrum, Base, and Solana.
- **Mempool Stream Listeners:** Captures pending transactions and smart contract calls before block inclusion.
- **Historical Wallet Graph Trees:** Maps complete funding origins, bridge hops, and contract interaction logs.

02 · Core Hybrid Analysis Engine (The Moat)

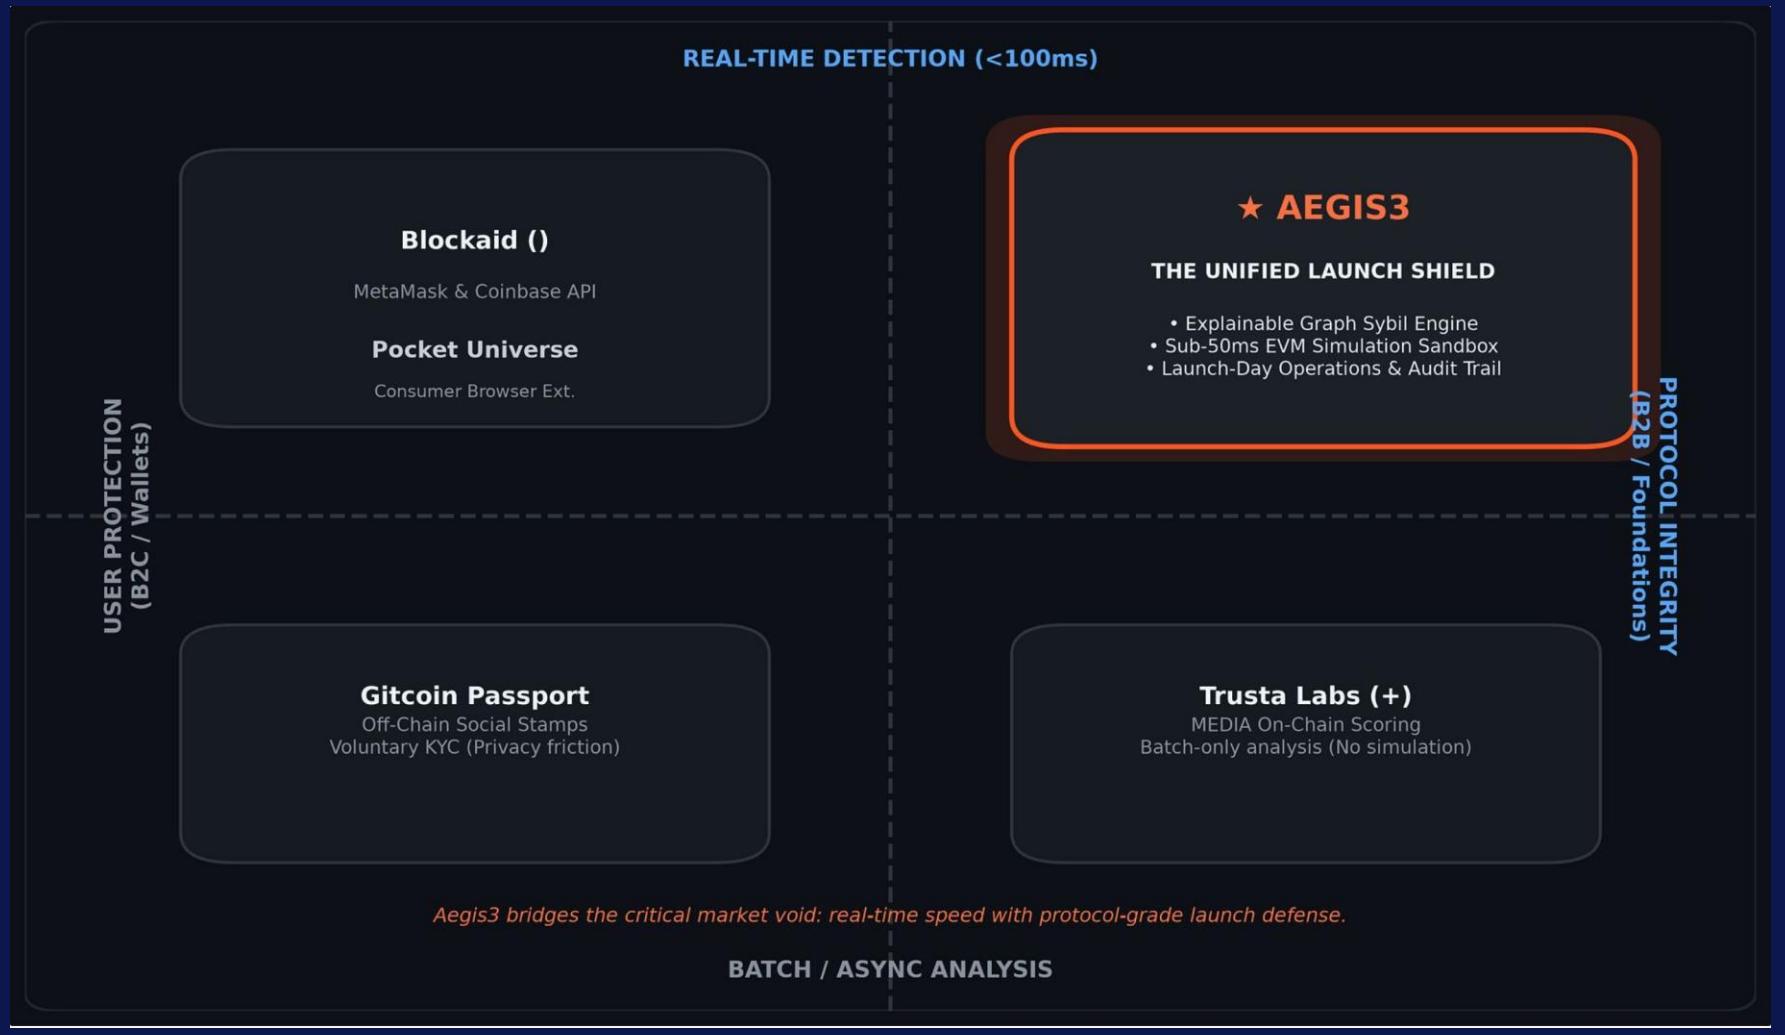

- **Inbound: Temporal Graph Clustering** —Leverages graph community detection (Louvain / DBSCAN), with a roadmap to Graph Neural Networks at scale
- **Outbound: Headless EVM Sandbox** — Forks state locally to run deterministic dry-runs in <50ms, intercepting Permit2 zero-transfers and malicious delegate calls.

03 · Explainable Decision Layer

- **Protocol Dashboard:** Replaces blunt blacklists with explainable, tiered authenticity scores (High-Conviction / Organic / Bot Ring) backed by transparent audit logs.
- **Developer API (<50ms):** Delivers sub-second balance impact alerts to Web3 wallets and dApp claim frontends before user signature.

Proprietary Behavioral Graph Heuristics & Deterministic Virtualization Engine

05 · COMPETITIVE LANDSCAPE

1. Blockaid

Dominant in wallet-side transaction scanning ($83M, Sequoia-backed). No Sybil detection or protocol-side launch tools.

2. Trusta Labs

Closest Sybil competitor. Batch-only graph analytics with no real-time simulation or launch-day operational support.

3. Gitcoin Passport

Off-chain social identity stamps. Privacy-hostile (requires linking Twitter/GitHub). Easily bypassed with purchased accounts.

Aegis3 owns the intersection: real-time capable, protocol-facing, with explainable scoring and launch-day operations.

04 · THE MARKET

High-margin B2B infrastructure in a $5.2B global market

Target buyers: Layer-1 and Layer-2 foundations, high-TVL DeFi protocols, Web3 wallet providers.

Enterprise launch audits

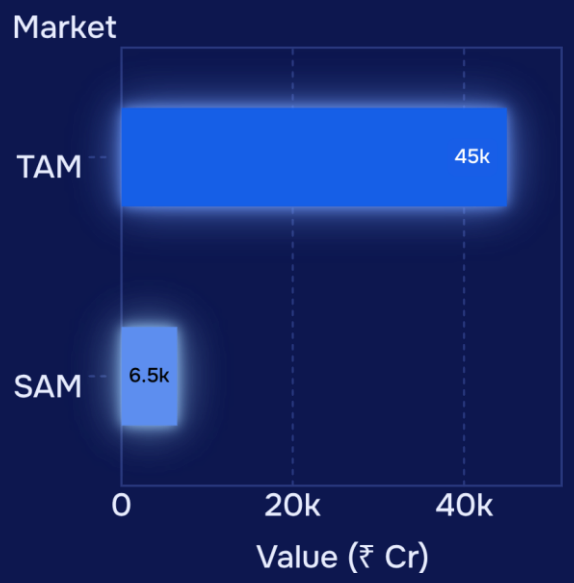

₹15L–₹35L per launch engagement (initial design-partner validated pricing hypothesis)
Upfront cash flow and design-partner validation.

Security API licensing

Tiered SaaS subscriptions for wallets, dApps, RPC providers seeking real-time simulation feeds.

SAM: ₹6,500 Cr ($800M launch security and simulation APIs)

SOM: ₹120 Cr ($15M)
Target across 100–150 protocol launch engagements over 3 years.

TAM ₹45,000 Cr ($5.4B global Web3 security) · Market opportunity

₹25 Lakhs funds a 12 to 14-month path to production proof

Seed ask: ₹25 Lakhs from KGP Forge, providing a disciplined 12–14 month runway.

Months 1–3

Finalize graph-clustering algorithms and backtest precision against historical LayerZero, Linea, and Arbitrum datasets.

Months 4–7

Deploy the low-latency EVM transaction-simulation API and launch a developer beta for Web3 wallets.

Months 8–12

Secure two institutional protocol launch partners and present production metrics at KGP Forge Demo Day.
